BHAVAN'S COLLEGE AUTONOMOUS, ANDHERI-WEST
PRACTICAL JOURNAL

Class: TYIT **Sem: V** **Roll No.: TYIT-11** **Date : 12 /09/2026**

Course Name: Big Data Analytics **Page no:**

Practical Number:- 4

Aim :- Implement an application that stores big data in Hbase / MongoDB and manipulate it using R/Python.

Code:

```
from pymongo import MongoClient
from collections import Counter
# Step1 Connection to MongoDB
client = MongoClient("mongodb://localhost:27017/")
db = client["your_database_name"]
collection = db["your_collection_name"]
# step2 Import Data (if not already imported)
# Example data import
data = [
 {"tag": "A", "value": 10},
 {"tag": "A", "value": 20},
 {"tag": "B", "value": 15},
 {"tag": "C", "value":5},
 {"tag": "A", "value": 25},
 {"tag": "B", "value":30},
 ]
# insert data into MongoDB
collection.insert_many(data)
#Step 3: Query - Get max value for tag "A"
max_doc = collection.find({"tag": "A"}).sort("value", -1).limit(1)
for doc in max_doc:
 print("Max value with tag A: ", doc)
#Step 4: Query: count entries per tag
tags = [doc["tag"] for doc in collection.find({},{"tag": 1})]
print("Ravit TYIT-11")
print("Tag counts:", Counter(tags))
```

Output :

```
Max value with tag A:  {'_id': ObjectId('6aa4f90a93d164444c62c41b'), 'tag': 'A',
 'value': 25}
Ravit TYIT-11
Tag counts: Counter({'A': 6, 'B': 4, 'C': 2})
```
